a = The health-related standards are based on the consumption of 2 L of water per day per person of a mass of 60kg over a period of 70 years.
b = Values in excess of those given in column 4 may negatively impact disinfection.
c = Low pH values can result in structural problems in the distribution system.
d = This is equivalent to nitrate at 50mg NO₃⁻ /L and nitrite as 3mg NO₂⁻ /L
e = Microcystin only needs to be measured where an algal bloom (>20 000 cyanobacteria cells per millilitre) is present in a raw water source. In the absence of algal monitoring, an algal bloom is deemed to occur where the surface water is visibly green in the vicinity of the abstraction, or samples taken have a strong musty odour.

MICROBIOLOGICAL RESULTS					
Somatic coliphages # c	P09/104	<i>Operational</i>	<i>Count per 10ml</i>	<i>Not detected</i>	0

KEY: ns = not specified / nd = not detected

a = Definitive, preferred indicator of faecal pollution.
b = Indicator of unacceptable microbial water quality, could be tested instead of E.coli , but is not the preferred indicator of faecal pollution.
 Also provides information on treatment efficiency and aftergrowth in distribution networks.
c = Confirms a risk of human infection and faecal pollution and also provides information on treatment efficiency.
 The detection of selected viruses confirms faecal pollution of human origin.
d = Confirms a risk of infection and faecal pollution and also provides information on treatment efficiency.
 The detection of selected protozoan parasites confirms a human health risk.
e = Indicates potential faecal pollution and provides information on treatment efficiency and aftergrowth.
f = Process indicator that provides information on treatment efficiency, aftergrowth in distribution networks and adequacy of disinfectant residuals.
g = Process indicator that provides information on treatment efficiency.
